Amendments to the Claims

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Original) Apparatus for canceling echoes over a communications channel, said apparatus comprising:

means for implementing, at the start of a communications session over a communications line, a plurality of echo cancellors to cancel echo on said communications line, said echo cancellors each operating to cancel echoes that arrive during a predetermined bandwidth of time, said predetermined band-widths of time being non-overlapping;

means for training each of said plurality of echo cancellors to produce a cancellation signal that cancels echoes arriving during the predetermined bandwidth of time associated with said echo cancellor; and

means for eliminating, after a predetermined training period, all echo cancellors that produce a cancellation signal below a predetermined threshold.

2. (Original) Apparatus of claim 1 wherein said bandwidths of time are equal in width to each other.

- 3. (Original) The apparatus of claim 2 wherein said non-overlapping bandwidths are each approximately 16 milliseconds apart.
- 4. (Original) The apparatus of claim 1 further comprising a graphical user interface for allowing a user to alter the predetermined threshold.
- 5. (Original) A method of canceling echoes in a telecommunications system comprising the steps of:

establishing a plurality of non-overlapping echo canceling filters;

training each of said non-overlapping echo canceling filters such that each produces a canceling signal within a predetermined time bandwidth;

eliminating all of said echo cancellors with the exception of those that produce a canceling signal above a predetermined threshold.

- 6. (Original) The method of claim 5 further comprising the step of adjusting said predetermined threshold based upon results produced by said method of claim 5.
- 7. (Original) The method of claim 5 wherein each of said non-overlapping filters occupies a time width of approximately 16 milliseconds.
 - 8. (Previously Added) An apparatus comprising:

a plurality of echo cancellors to cancel echo on a communications line, the echo cancellors each operating to cancel echoes that arrive during a predetermined bandwidth of time, the predetermined bandwidths of time being non-overlapping; and

a control circuit in electrical communication with the plurality of echo cancellors to eliminate, after a predetermined training period, all echo cancellors that produce a cancellation signal below a predetermined threshold.

- 9. (Previously Added) The apparatus of claim 8, wherein said bandwidths of time are equal in width to each other.
- 10. (Previously Added) The apparatus of claim 8, wherein said nonoverlapping bandwidths are each approximately 16 milliseconds in width.
- 11. (Previously Added) The apparatus of claim 8, further comprising a graphical user interface for allowing a user to alter the predetermined threshold.
